 Conclusions

 The Great Recession and policy interventions
 Recession
 and policy interventions
 Conclusions

The recent recession has induced:

- Significant changes in the conduct of monetary policy, with interest rates stuck at the zero lower bound
- A debate on the best way to mitigate the consequences of a recession when at the zero-lower-bound:
  - Robust fiscal intervention combined with a reduced emphasis on inflation stabilization
  - Reluctance to explicitly abandon macroeconomic policies that have been successful before the recession

Introduction 0●00	The Model 00000000	Policy Dilemma 000	Escaping the Great Recession	Conclusions
Model se	etup			

We model an economy in which:

- Recurrent large negative demand shocks can force the economy to the zero lower bound
- **②** Two policy combinations characterize policy makers' behavior:
  - Monetary-led policy mix: The fiscal authority strongly reacts to debt and the monetary policy rule satisfies the Taylor principle
  - Fiscally-led policy mix: The fiscal authority disregards the level of debt and the Taylor principle does not hold

Agents are aware of the possibility of...

- ...zero lower bound episodes,
- …changes in policy makers' behavior,
- Image: ...and the link between the two

Introduction 00●0	The Model 00000000	Policy Dilemma 000	Escaping the Great Recession	Conclusions
Main res	ults			

- Out of the zero bound the monetary-led regime leads to a stable macroeconomic environment
- At the zero bound the policy makers' dilemma arises,
  - the monetary-led policy mix would exacerbate the recession while keeping the long-run macroeconomic volatility low
  - the fiscally-led policy mix would mitigate the recession while raising the long-run macroeconomic volatility
- This dilemma could be resolved by committing to inflate away only the portion of debt resulting from the recession itself
- High uncertainty is an inherent implication of entering the zero lower bound, whereas deflation is not

Introduction The Model Policy Dilemma Escaping the Great Recession Conclusions ooo OOO OOO OOO OOO

• Linearized Euler Equation:

$$y_{t} = \tilde{E}_{t}\left(y_{t+1}\right) - \left(R_{t} - \tilde{E}_{t}\left(\pi_{t+1}\right)\right) + d_{t} - \tilde{E}_{t}\left(d_{t+1}\right) \quad (1)$$

• Expectation augmented Phillips curve:

$$\pi_t = \beta \tilde{E}_t(\pi_{t+1}) + \kappa(y_t - z_t)$$
(2)

Stochastic processes of the shocks:

$$d_t = \overline{d}_{\xi^d_t} \tag{3}$$

$$z_t = \rho_z z_{t-1} + \sigma_z \epsilon_{z,t} \tag{4}$$

where  $\epsilon_{z,t} \sim N(0,1)$ , and the preference shock  $\overline{d}_{\xi_t^d}$  can assume two values, high or low  $(\overline{d}_h \text{ and } \overline{d}_l)$ . •  $\xi_t^d$  evolves according to the transition matrix  $H^d$ :

$$H^{d} = \begin{bmatrix} p_{hh} & 1 - p_{||} \\ 1 - p_{hh} & p_{||} \end{bmatrix}$$

Introduction 0000	The Model o●oooooo	Policy Dilemma 000	Escaping the Great Recession	Conclusions
Policy m	akers • Details			

• Linearized government budget constraint:

$$b_t = \beta^{-1} b_{t-1} + b \beta^{-1} (R_{t-1} - \pi_t - \Delta y_t) - s_t$$

• Fiscal rule (net lump-sum taxes):

$$\begin{aligned} s_t &= \delta_{b,\xi_t^p} b_{t-1} + \delta_y \left( y_t - z_t \right) + \sigma_x x_t \\ x_t &= \rho_x x_{t-1} + \varepsilon_{x,t}, \ \varepsilon_{x,t} \sim N\left(0,1\right) \end{aligned}$$

Monetary rule:

• Out of the zero lower bound  $(\xi_t^d = h)$ :

$$R_{t} = \rho_{R}R_{t-1} + (1-\rho_{R})\left(\psi_{\pi,\tilde{\varsigma}_{t}^{\rho}}\pi_{t} + \psi_{y}\left[y_{t} - z_{t}\right]\right) + \sigma_{R}\epsilon_{R,t}$$

2 At the zero lower bound  $(\xi_t^d = I)$ :  $R_t = -\log(R)$

Introduction The Model Policy Dilemma Escaping the Great Recession Conclusions

# Policy Regime Changes - Back

• Monetary-led policy mix (*Ricardian*):

$$\psi_{\pi} \left( \xi_t^p = M; \ \xi_t^d = h \right) = \psi_{\pi}^M = 2 > 1$$
  
$$\delta_b \left( \xi_t^p = M; \ \xi_t^d = h \right) = \delta_b^M = .03 > \beta^{-1} - 1$$

• Fiscally-led policy mix (*NonRicardian*):

$$\psi_{\pi} \left( \xi_t^p = F; \ \xi_t^d = h \right) = \psi_{\pi}^F = .8 < 1$$
  
$$\delta_b \left( \xi_t^p = F; \ \xi_t^d = h \right) = \delta_b^F = 0 < \beta^{-1} - 1$$

• Zero-lower-bound (ZLB) Regime :

$$\xi_t^d = I \longrightarrow R_t = -\log(R)$$
  
$$\delta_b \left(\xi_t^d = I\right) = \delta_b^F = 0 < \beta^{-1} - 1$$

Introduction	The Model	Policy Dilemma	Escaping the Great Recession	Conclusions
0000	000●0000	000	0000	

- Agents observe the history of endogenous variables and the history of shocks
- It is assumed that agents do not directly observe the policy mix  $\xi_t^p \in \{M, F\}$
- $\implies$  Out of the ZLB, agents infer the policy mix  $\xi_t^p$
- $\implies$  At the ZLB, agents cannot observe the policy mix  $\xi_t^p$  that would have occurred if the demand shock was not realized
  - In a sense, the central bank is forced to the ZLB regime, which looks like a radical fiscally-led policy mix

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

Introduction The Model Policy Dilemma Escaping the Great Recession Conclusions

### Addressing the Policymaker's Dilemma

- Commitment to inflate away only the portion of debt resulting from demand shocks that lead to large recessions
  - Denote the debt and inflation of a shadow economy in which demand shocks are shut down as  $b_t^c$  and  $\pi_t^c$
  - Write the policy rules as

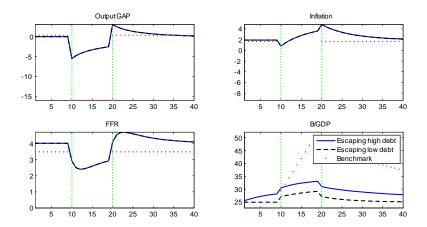

$$s_{t} = \delta_{b}^{M} b_{t-1}^{c} + \delta_{b}^{F} \left( b_{t-1} - b_{t-1}^{c} \right) + \delta_{y} \left( y_{t} - y_{t}^{n} \right) + x_{t}$$

$$R_{t} = (1 - \rho_{R}) \left( \psi_{\pi}^{M} \pi_{t}^{c} + \psi_{\pi}^{F} \left( \pi_{t} - \pi_{t}^{c} \right) \right) + \dots$$

• Compare with outcomes when policymakers always behave according to the monetary-led regime out of the ZLB

 → IRF Perf Info

 Introduction
 The Model
 Policy Dilemma
 Escaping the Great Recession
 Conclusions

 Why Does This Strategy Work?

- Automatic stabilizer: This behavior determines an increase in short run expected inflation exactly when necessary
  - i.e., when the negative demand shock hits the economy

#### Macroeconomic stability is retained after the recession

• Agents understand that the fiscally-led policy mix occurs only in response to shocks leading to *extraordinary recessions* 

Summary	of the res	sulte		
Introduction 0000	The Model 00000000	Policy Dilemma 000	Escaping the Great Recession	Conclusions

- A DSGE model with recurrent ZLB events
- Intermodel highlights why policy makers...
  - are reluctant to abandon fiscal discipline
  - might be tempted to do so to escape deep recessions
- **O** Possible resolution of this policy dilemma:
  - $\longrightarrow$  Inflate away only debt accumulated  $\mathit{because}$  of the recession
- Uncertainty is an implication of entering the ZLB; deflation is not
- Methodological contribution:

 $\longrightarrow\,$  Modeling the ZLB while keeping the DSGE model tractable

Introduction The Model Policy Dilemma Escaping the Great Recession Conclusions

### Details about linearization • Back

Markov switching process for  $d_t$  represents a non-Gaussian shock

- $\textbf{O} \ \text{Compute the ergodic steady state } d_{ss} \text{ for the demand shock } d_t$
- **2** Verify that the ZLB is not binding at  $d_{ss}$
- Sinearize/loglinearize around the steady state
- Use a VAR and a vector of dummy variables to model the Markov-switching process:

$$\left[\begin{array}{c} e_{1,t} \\ e_{2,t} \end{array}\right] = \left[\begin{array}{c} p_{hh} & 1-p_{ll} \\ 1-p_{hh} & p_{ll} \end{array}\right] \left[\begin{array}{c} e_{1,t-1} \\ e_{2,t-1} \end{array}\right] + \left[\begin{array}{c} v_{1,t} \\ v_{2,t} \end{array}\right]$$

where

$$e_t \in \{[1;0], [0;1]\}$$
  
 $v_t \in \{[1 - p_{hh}; p_{hh} - 1], [-p_{hh}; p_{hh}], [p_{II}; -p_{II}], [p_{II} - 1; 1 - p_{II}]\}$ 

- Suppose the fiscal authority does not commit to repay the fraction of public debt resulting from preference shocks
- We would like to write the Taylor Rule as follows:

$$s_{t} = \delta_{b}^{M} b_{t-1}^{c} + \delta_{b}^{F} b_{t-1}^{nc} + \delta_{y} \left( y_{t} - y_{t}^{n} \right) + x_{t}$$

where  $b_t^c$  denotes debt due to all shocks but preference shocks and  $b_t^{nc}$  is debt only due to preference shocks

• **BUT** what is the law of motion for the two targets  $b_t^c$  and  $b_t^{nc}$ ?

- ullet Conjecture that the ZLB is not binding  $\Longrightarrow$  the model is linear
- Model linearity leads to three useful results:
  - In equilibrium,  $b_t = \sum_{s=0}^{\infty} \phi_s L^s \varepsilon_t$  and  $b_t^c = \sum_{s=0}^{\infty} \tilde{\phi}_s L^s \varepsilon_t$ , where  $\phi_s(i_d) = 0$  for all s

3 
$$\phi_{s}(j) = \tilde{\phi}_{s}(i)$$
 if  $j = i$  and  $j \neq i_{d}$ 

3 
$$b_t^{nc} = \sum_{s=0}^{\infty} (\phi_s - \tilde{\phi}_s) L^s \varepsilon_t = b_t - b_t^c$$

- It follows that
  - $b_t^c$  is the public debt of a **shadow economy** in which preference shocks are shut down
  - The fiscal rule in the actual economy

$$s_{t} = \delta_{b}^{M} b_{t-1}^{c} + \delta_{b}^{F} \left( b_{t-1} - b_{t-1}^{c} \right) + \delta_{y} \left( y_{t} - y_{t}^{n} \right) + x_{t}$$

$$R_t = (1 - \rho_R) \left( \psi_\pi^M \pi_t^c + \psi_\pi^F \left( \pi_t - \pi_t^c \right) \right) + \dots$$

Introduction The Model Policy Dilemma Escaping the Great Recession Conclusions

Monetary/Fiscal Policy Mix • Back

Following Leeper (1991) we can distinguish four cases:

	Active Fiscal (AF)	Passive Fiscal (PF)
Active Monetary (AM)	No Solution	Determinacy
Passive Monetary (PM)	Determinacy	Indeterminacy

- Active Monetary Policy: Taylor principle is satisfied  $(\psi_{\pi,\xi_t^{
  ho}}>1)$
- Passive Fiscal Policy: Taxes react strongly to debt  $(\delta_{b,\xi_t^p} > \beta^{-1} 1 \rightarrow \beta^{-1} \delta_{b,\xi_t^p} < 1)$

Introduction The Model Policy Dilemma Escaping the Great Recession Conclusions

### Contradictory announcements

#### Policy makers' signals can be contradictory

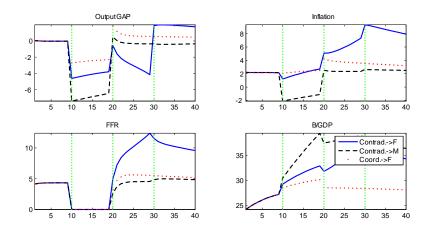

We assume that the economy enters the ZLB with an above steady state stock of debt and we consider three different scenarios:

- Policy makers announce that the monetary-led regime will be abandoned
- Fiscal authority → fiscal discipline will be abandoned Monetary authority → inflation stability will be preserved
  - Conflict and agents expect fiscal authority to prevail
  - 2 Conflict and agents expect monetary authority to prevail

 Introduction
 The Model
 Policy Dilemma
 Escaping the Great Recession
 Conclusions

 Policymakers' Dilemma and Volatility at the ZLB
 Dilemma and Volatility
 Dilemma and Vol

- Announcing that monetary-led regime will prevail
  - Recession and deflation in line with traditional view of the ZLB
  - **②** Post-crisis volatility goes back to the pre-crisis levels
- Announcing that fiscally-led regime will prevail
  - Inflation goes up and mitigates the recession
    - Debt accumulated during the crisis likely to be inflated away
  - Post-crisis level of volatility rises as
    - As the recession is over, Taylor principle not satisfied and macroeconomy not insulated from fiscal shocks

• Uncertainty regime leads to predictions in line with the data

- Still no deflation at the ZLB
- Higher volatility due to policy uncertainty and large macroeconomic effects of fiscal shocks

Backer, Bloom, and Davis (2013) and Kitsul and Wright (2013)
